GNOME Shell extensions

- Keyboard Informer — show modifier and lock-key states in GNOME Shell 5729 Downloads
- Blur Wallpaper — create a smooth, adjustable blurred wallpaper 1003 Downloads
- My Vision — save and quickly switch between display profiles 377 Downloads
- Window Shuffle — distribute windows across workspaces and collect them back 114 Downloads

NixOS Tools

One recipe. Multiple machines. Reproducible NixOS servers.

- NixBerry lets you build and manage servers from declarative configuration. Keep the system in a shared recipe, then define each machine's configuration, platform, network and resources — making it easier to recreate a server or add another machine. **Platforms:** QEMU/KVM (libvirt) · Hyper-V · Proxmox VE · VirtualBox · VMware Workstation · Raspberry Pi 5.

A starting point for command-line applications.

- NixonCpp — Create your C++ applications and libraries. A running WebAssembly build that documents the project it represents.

Translation Bundle

Translate selected text with your own AI translation server. Start with the server, then choose the extension for your desktop, browser or email client:

- Translation API — the shared server, using Ollama and `translategemma:4b` by default. Its README covers installing Ollama, downloading the model and starting the API on your computer.
- TranslatePlace — a GNOME Shell extension with two target languages, configurable shortcuts, local history and optional automatic replacement of selected text.
- WebTranslatePlace — translate selected drafts in Chrome/Chromium and Firefox, or selected email text in Thunderbird. Replace selections while composing; view translations separately while reading email. Includes draft history, two target languages and additional Discord message translation.

Both extensions connect to Translation API at `http://127.0.0.1:5001` by default. Follow the chosen extension's README for installation. WebTranslatePlace also has Safari and GNOME Web targets; Safari requires live verification, and GNOME Web is experimental with known failures.

Filesystem tools

- Modern Midnight Commander — a fork with trash actions, Wayland clipboard support, DotName skins, and ultra-fast ZIP extraction, packaged with Nix.

Backup tools

- SafeData — Universal backup script for LVM volumes and regular directories. It supports rsync and tar backups with include, exclude, or all filtering rules while preserving extended filesystem metadata.

Music production hardware & software

- DreamScaler — DreamScaler brings musical scales, harmony, and color to your keys with a standalone app and an LED strip.
- Bitwig Cheatsheet — find Bitwig Studio keyboard shortcuts for Windows, Linux, and macOS mapped to a standard ISO/QWERTY keyboard layout.
- Bitwig Transport Control Script — control Bitwig Studio transport with mouse side buttons, even when a plugin window has focus, on Linux with X11.
