🧩 GNOME Shell extensions

- **Keyboard Informer** 5717 Downloads — show modifier and lock-key states in GNOME Shell.
- **Blur Wallpaper** 994 Downloads — create a smooth, adjustable blurred wallpaper.
- **My Vision** 376 Downloads — save and quickly switch between display profiles.
- **Window Shuffle** 108 Downloads — distribute windows across workspaces and collect them back.

🔄 Translation Bundle

Translate selected text with your own AI translation server. Start with the server, then choose the extension for your desktop, browser or email client:

- **Translation API** — the shared server, using Ollama and `translategemma:4b` by default. Its README covers installing Ollama, downloading the model and starting the API on your computer.
- **TranslatePlace** — a GNOME Shell extension with two target languages, configurable shortcuts, local history and optional automatic replacement of selected text.
- **WebTranslatePlace** — translate selected drafts in Chrome/Chromium and Firefox, or selected email text in Thunderbird. Replace selections while composing; view translations separately while reading email. Includes draft history, two target languages and additional Discord message translation.

Both extensions connect to Translation API at `http://127.0.0.1:5001` by default. Follow the chosen extension's README for installation. WebTranslatePlace also has Safari and GNOME Web targets; Safari requires live verification, and GNOME Web is experimental with known failures.

🛠️ Administration tools

- **Modern Midnight Commander** — a fork with trash actions, Wayland clipboard support, DotName skins, and ultra-fast ZIP extraction, packaged with Nix.

🛠️ Backup tools

- **SafeData** — Universal backup script for LVM volumes and regular directories. It supports rsync and tar backups with include, exclude, or all filtering rules while preserving extended filesystem metadata.

💻 Development tools and 📐 templates

- **NixonCpp** — Create your C++ applications and libraries. A running WebAssembly build that documents the project it represents.

🎹 Music production hardware & software

- **DreamScaler** — DreamScaler brings musical scales, harmony, and color to your keys with a standalone app and an LED strip.
- **Bitwig Cheatsheet** — find Bitwig Studio keyboard shortcuts for Windows, Linux, and macOS mapped to a standard ISO/QWERTY keyboard layout.
- **Bitwig Transport Control Script** — control Bitwig Studio transport with mouse side buttons, even when a plugin window has focus, on Linux with X11.
